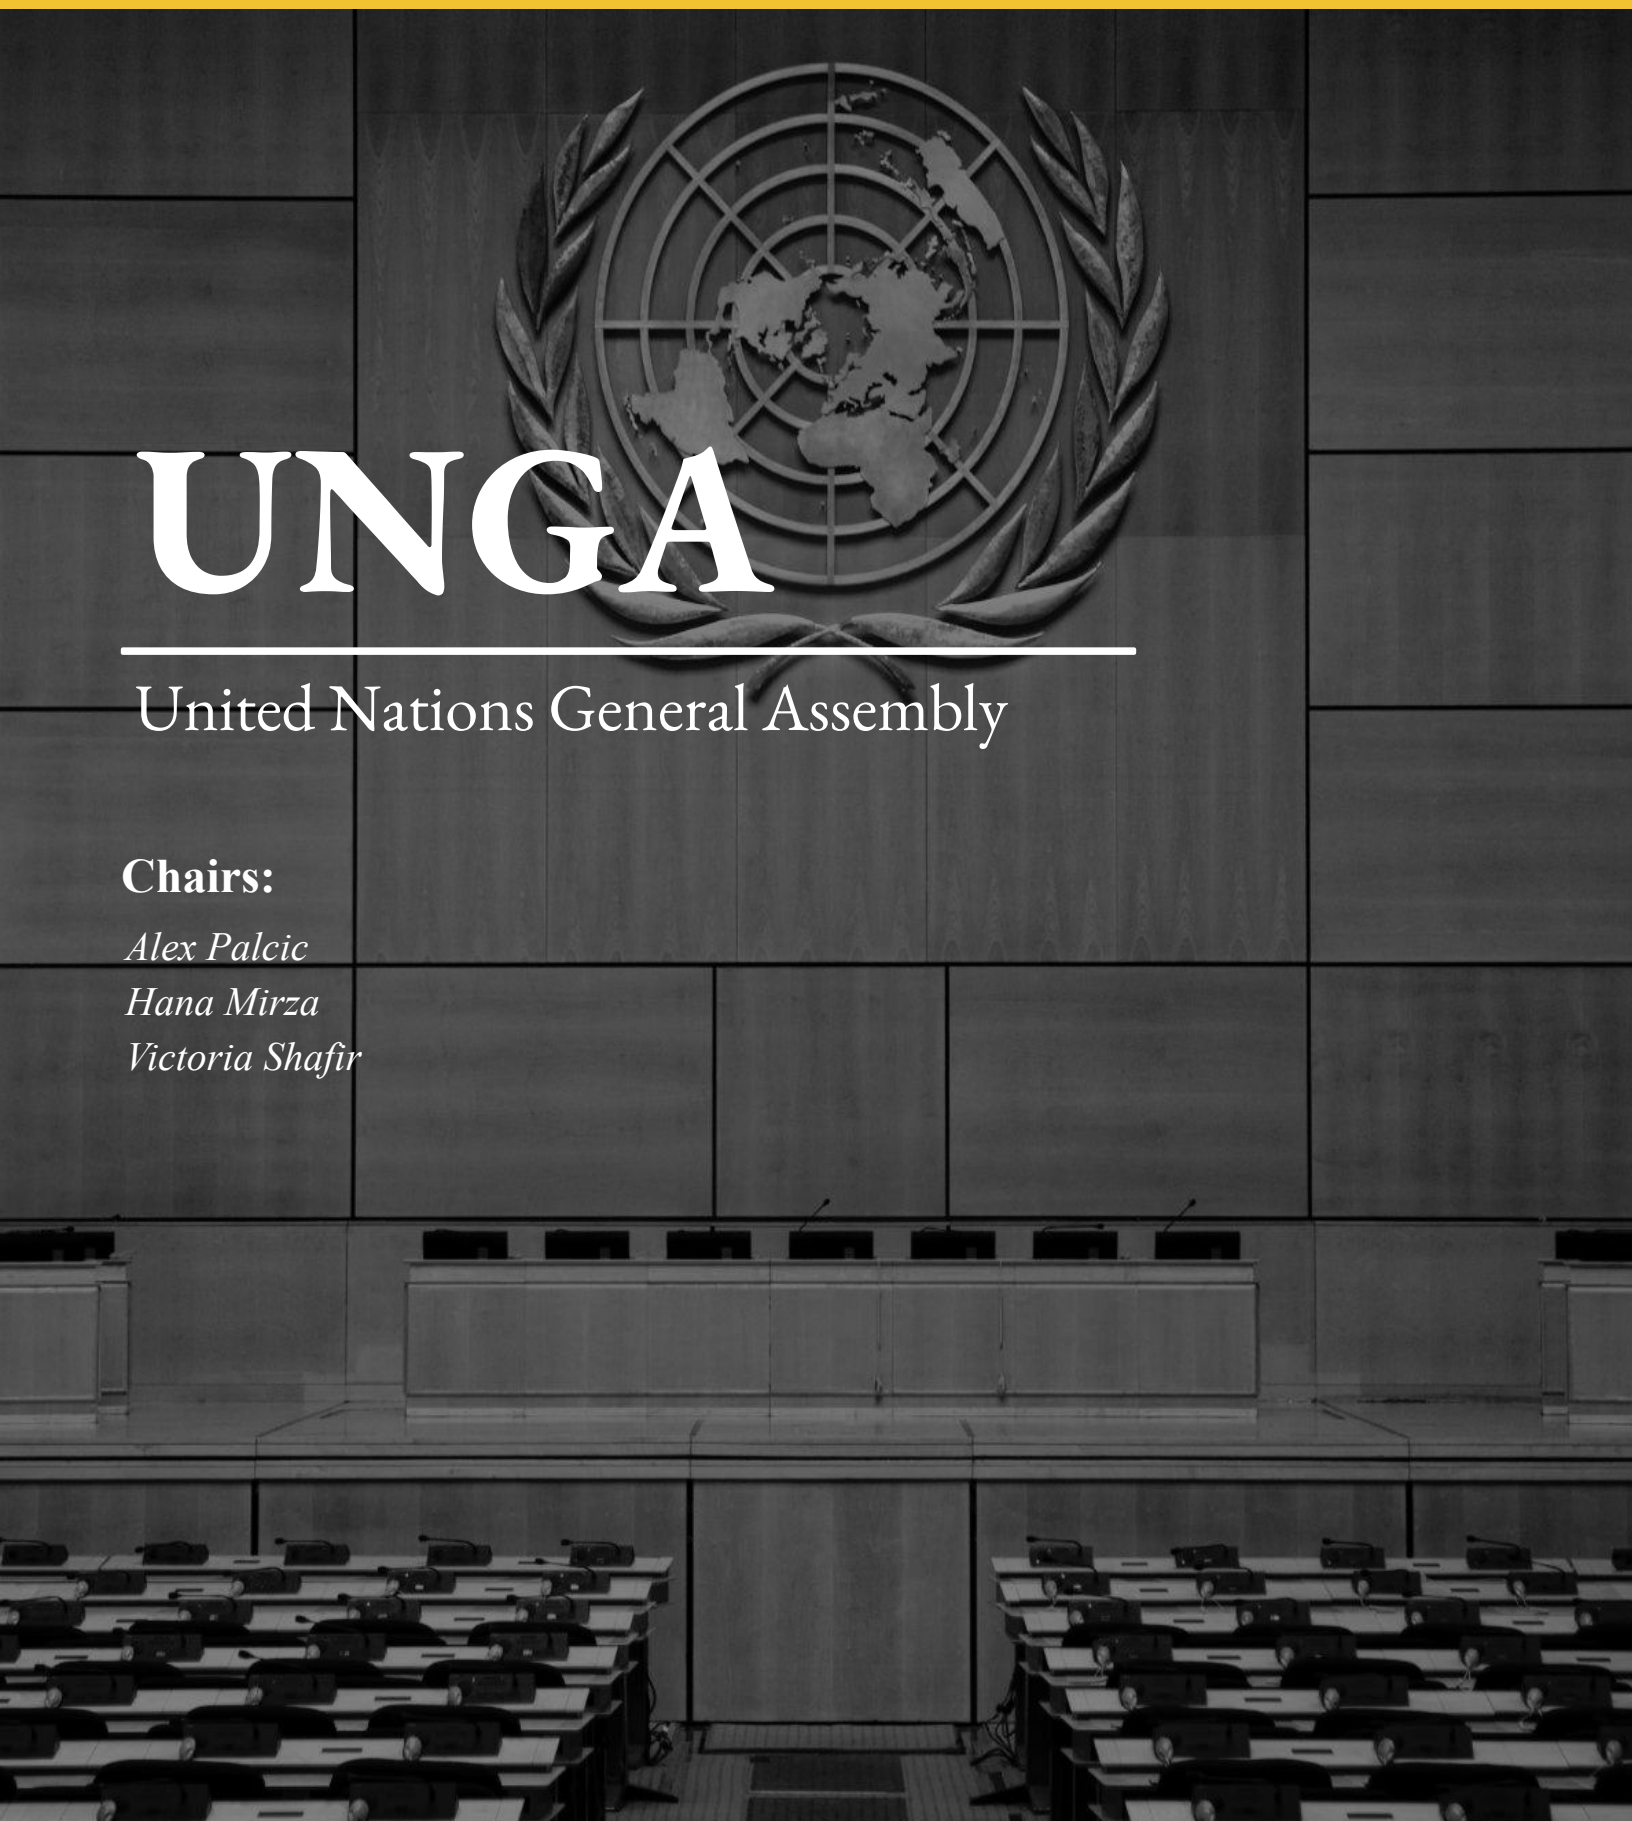
Amity Model United Nations I

May 2nd, 2026



UNGA

United Nations General Assembly

Chairs:

Alex Palcic
Hana Mirza
Victoria Shafir

Chairs: Alex Palcic, Hana Mirza, & Victoria Shafir

Committee: United Nations General Assembly

Topic: Establishing an Artificial Intelligence Regulatory Framework

I. Introduction

Hello Delegates!

It is with a mixture of excitement and trepidation that we welcome you to the inaugural General Assembly of Amity's Model UN Conference. Because of this, we have decided to choose a topic that we are sure will foster some lively debate. As AI continues to permeate our everyday lives –which you are already well aware of– we ask that you look into precisely what this will mean not just in relation to what you're allowed to use on your homework, but how it can affect countries on an international scale.

We encourage you to think about Artificial Intelligence in terms of how it relates to every major problem facing the world today. This is a topic that will give you the freedom to advocate for innovation in areas that matter to your country, to rearrange the world order. The future of climate change, war prevention, healthcare, civil rights, and much more will be affected by the choices made by world leaders today, and you will need to understand how these things must factor into your possible solutions. We are looking for approaches that address the implications that this technology has across all sectors internationally and domestically, and solutions that can adapt as AI does.

We have put a lot of work into this committee and this conference, though it is still organized by high schoolers. If you have any questions, comments, or concerns please feel free to reach out to us or other organizers, as we want this to be an opportunity for us to learn together. If you are new to MUN procedure or having trouble with your research, please, please, please email us. We want serious political debate to be as fun as possible!

We can't wait to meet all of you and see how you decide to approach this in ways that ambassadors haven't even thought of!

Your Chairs,

Hana, Victoria, & Alex

II. Topic: Establishing an Artificial Intelligence Regulatory Framework

A. Topic History

Artificial intelligence (AI) has rapidly developed over the past several decades and has become one of the most important emerging technologies in the modern world. AI refers to computer systems that are able to perform tasks that normally require human intelligence, such as learning, decision-making, language processing, and pattern recognition. While early research into artificial intelligence began in the 1950s, the technology has advanced significantly in the 21st century due to improvements in computing power, data availability, and machine learning techniques.

In recent years, artificial intelligence has been integrated into many aspects of daily life. AI is used in industries such as healthcare, transportation, finance, and communication. For example, AI systems assist doctors in diagnosing diseases, power recommendation systems on social media and online platforms, and help businesses analyze large amounts of data. These innovations have created significant economic opportunities and have the potential to improve efficiency and productivity worldwide.

However, the rapid expansion of artificial intelligence has also raised serious concerns about its potential risks and misuse. Governments, researchers, and international organizations have expressed concern about issues such as algorithmic bias, loss of privacy, misinformation, and the development of autonomous weapons systems. There are also concerns about how AI could impact employment, cybersecurity, and global stability if left unregulated.

Because AI technologies are developed and used across national borders, many experts believe that international cooperation is necessary to address these challenges. In recent years, governments and international organizations have begun discussing possible frameworks for regulating artificial intelligence. For example, several countries and regional organizations have proposed guidelines or legislation focused on responsible AI development and ethical standards. In addition, discussions within the United Nations have emphasized the importance of ensuring that artificial intelligence technologies respect human rights and contribute to sustainable development.

Despite these efforts, there is currently no comprehensive global framework that governs the development and use of artificial intelligence. As AI technologies continue to advance at a rapid pace, the international community faces the challenge of creating regulations that protect global security, promote ethical innovation, and ensure that the benefits of AI are shared equitably among all nations. The United Nations General Assembly therefore provides an important platform for member states to debate and develop potential international approaches to AI governance.

B. Current Situation

In recent years, AI has moved from an emerging technology to a central issue in international policy discussions. Governments, technology companies, and international organizations are increasingly debated how AI systems can be regulated as the capabilities of AI continues to expand. Recent advances in AI have made it possible for AI systems to produce human-like text, images, and data analysis, raising new questions about accountability, transparency, and oversight.

With AI use reaching unprecedented heights, numerous countries and various regions have begun implementing their own regulatory approaches. For example, the European Union has taken a leading role in proposing comprehensive AI legislation through its AI Act, which aims to classify Artificial Intelligence systems based on levels of risk. Meanwhile, the United States has focused on developing national guidelines and policies to promote responsible AI development while also maintaining crucial technological innovation. Other countries, such as China have introduced regulations addressing generative AI services and the use of algorithms in various online platforms. These differing regulatory strategies highlight the current lack of a unified global approach to AI regulatory frameworks.

International organizations have also begun to address the challenges posed by AI. For instance, within the United Nations, discussions have been focused on the ethical implications of AI and the need to ensure that emerging technologies align with global human rights standards. Additionally, concerns have been raised about the use of AI in areas such as autonomous weapon systems, large-scale surveillance systems, and the spread of misinformation. At the same time, many developing nations have emphasized the importance of ensuring equitable access to AI technologies and preventing a widening technological divide between nations.

Despite these ongoing efforts, international coordination of AI regulations remains limited. Rapid technological advancements, differing national priorities, and the nature of rapidly evolving AI technologies, make it difficult to create a unified AI regulatory framework. As AI continues to shape economies, security systems, and communication networks worldwide, the international community faces increasing pressure to establish global standards that promote responsible innovation while minimizing potential risks.

C. Questions to Consider

- What are the potential benefits and risks of artificial intelligence for global development, economic growth, and international security?

- Should artificial intelligence be regulated at the national level, regional level, or through international agreements, and what role should the United Nations play in coordinating these efforts?

- How can governments balance innovation in artificial intelligence technologies with the need to prevent misuse, harm, or unethical applications?

- What ethical principles should guide the development and deployment of artificial intelligence systems worldwide?

- How can the international community ensure that artificial intelligence systems respect human rights, privacy, and civil liberties?

- What measures can be taken to prevent artificial intelligence from being used for harmful purposes, such as autonomous weapons, mass surveillance, or disinformation campaigns?

- How can countries work together to ensure transparency and accountability in artificial intelligence development?

- Should there be global standards for AI safety, testing, and oversight, and how could these standards be enforced?

- How can developing countries be supported in accessing the benefits of artificial intelligence while avoiding technological inequality?

- What role should private technology companies, research institutions, and civil society organizations play in shaping AI governance?

- How can the international community respond to the rapid pace of AI development while ensuring regulations remain effective and adaptable?

- What existing international frameworks or organizations could help support the creation of an artificial intelligence regulatory system?
